Abstract

This study aims to investigate how employee performance is impacted by work environment and motivation. In this study, a descriptive and verifiable strategy was employed. Statements (questionnaires) sent to employees of one of the Bandung convective enterprises served as the study's data source. There are thirty-five participants in the study. The research utilizes both descriptive and verificative statistical methodologies. They helped with the SPSS (Statistical et al.) version 26 application by applying Correlation Data Analysis, Path Analysis, and Determination Coefficient Analysis. Motivation, Work Environment, and Employee Performance in one of the Bandung convection enterprises was determined to be related based on the entire data analysis. Thus, the work environment and motivation have an impact on employee performance. Other elements that may impact employee performance should be covered in this study. Furthermore, in comparison to the work environment, motivation has less of an effect. Therefore, the business ought to prioritize the work environment while simultaneously maximizing employee motivation at one of Bandung's convective businesses.

Keywords: *Motivation, Work Environment, Employee Performance*

Introduction

The potential of human resources is fundamentally one of the assets in an organization's operational system and is necessary for accomplishing its goals. As a result, the business must manage its human resources as efficiently as possible. Guest, (2017); Otoo (2019) define employee performance as the outcome that workers can accomplish by their skills. Performance is the actual output that workers produce when completing duties delegated to them according to the standards and goals established by the business. (Santoso & Riyanto, 2020) Human resources are one of the strategic resources that a business possesses and need to be continuously enhanced, according to Arif (2021) Information about employee performance measurement from one of Bandung's leading enterprises reveals that teamwork, leadership, discipline, integrity, commitment, and service orientation are the main factors used to evaluate employee performance. The researcher's findings identified two problems: the work environment and motivation. This data shows that worker performance at one of Bandung's convection enterprises has yet to reach the ideal level. Yusuf Iis et al., (2022) asserts that motivation results from an employee's attitude toward their work environment and that ability and motivation elements influence performance attainment.

ISSN Online: 3026-0906

Leaders must take note of some aspects in order to maximize staff performance. Low employee motivation is said to be the root cause of subpar employee performance. (Elqadri et al., 2015; Sugiarti, 2022) It is well known that low motivation at work will cause employees' enthusiasm to give their all to their work, lowering work enthusiasm and employee performance quality. Motivation, on the other hand, is the internal drive that propels employees to reach a goal. Upon analyzing one of the biggest

companies in Bandung, it can be said that there is a lack of incentive for staff members to be more driven to work, which eventually results in a decline in their motivation to increase performance, affecting the business's performance. According to Aiyub et al., (2021), an organization's performance and success are influenced by the caliber of its leaders, employees, and subordinates; for this reason, proficiency in performance management is crucial. This suggests that one of the Bandung convection enterprises has undermotivated staff resources. There were variations in the absenteeism rate of employees at one of the major enterprises in Bandung between April and July of 2022. The events that field researchers discovered point to a need for more initiative, teamwork, compliance with regulations, and employee motivation to reach high-performance standards. Several indicators point to a decline in employee work motivation, including the workplace culture, connections with leaders, coworkers, and partners, and a lack of recognition for individuals who meet goals and break corporate policies.

The work environment is one of the variables that influences employee performance. Employees are significantly impacted by their work environment, which motivates them to complete tasks more quickly and successfully. (Machmud & Sidharta, 2021) Thus, a business or organization must maintain a favorable working environment for its workers. According to Azmy et al., (2022), the workplace is everything that surrounds employees and impacts how they do the duties that have been allocated to them. Therefore, a business or organization must maintain the working environment for its staff members, as this directly affects how well workers perform in carrying out their duties. On the other hand, poor maintenance

might result in decreased worker performance. This essay aims to ascertain the degree to which employee performance at one of the Bandung convective enterprises is impacted by motivation and the work environment, based on the issue above.

Research Method

In order to look at a specific population or sample, the researcher in this study used quantitative research, which is founded on positivist philosophy. Research instruments are usually used for data gathering, sampling strategies are usually random, and data processing is quantitative and statistical to test preconceived assumptions.

Validity Test

Construct validity, a particular abstraction or generalization made expressly for research purposes and having a narrow definition is the validity employed in this study.

Reliability Test

When a measurement tool can be relied upon to gather data, it is deemed reliable. Dependable data will come from a dependable instrument.

Path Analysis

The regression model's path analysis feature can be used to examine the cause-and-effect relationship between two variables. Using correlations, regressions, and pathways, the path analysis technique determines the direct and indirect impacts of one set of variables acting as a cause on another set of variables acting as an effect. The path coefficient, as pyx, indicates the contribution size tested in the influence of X1 and X2 on Y.

Results and Discussion

The following are the characteristics of respondents from this study:

Table 1. Respondent Characteristics

No.	Characteristics	Frequency	Presentation
1.	Gender		
	- Woman	12	34%
	- Man	23	66%
2.	Age		
	- < 25 year	10	29%
	- 26-35 year	15	43%
	- 36 -4 5 year	5	14%
	- > 45 year	5	14%
3.	Education		
	- SMA	20	57%
	- Diploma	10	29%
	- Sarjana	3	8%
	- Magister	2	6%

According to the statistics, women comprise only 34% of survey respondents, with men making up the bulk of respondents (66%). Regarding age, the largest group is those under 25 (29%), followed by those between the ages of 26 and 35 (43%). Just 14% of respondents fall into the 36–45 year old age group and the 45+ age group. Regarding education, most respondents (57%) have a high school diploma, while another 29% have only completed their high school education. Just 8% of respondents said they have a bachelor's degree, while 6% said they have a master. Overall, the poll results show that young males with formal education up to a high school diploma or above make up many respondents.

Table 2. Results of Validity and Reliability Testing

Motiv	vation	Work Environment			
Item	Corr.	Item	Corr.		
1	0,345	1	0,390		
2	0,325	2	0,361		
3	0,381	3	0,334		
4	0,359	4	0,472		
5	0,317	5	0,355		
6	0,375	6	0,369		
7	0,303	7	0,392		
8	0,547	8	0,411		
9	0,499	9	0,423		
10	0,311	10	0,400		
11	0,448	11	0,428		
12	0,333	12	0,365		
13	0,365	13	0,408		
14	0,397	14	0,578		
15	0,308	15	0,474		
Cronbach Alpha					
X1	0,770				
X2	0,801				
Y	0,751				

It is, therefore, possible to infer that items 1 through 15 of the statements in the Motivation and Work Environment variable instrument above are legitimate and appropriate for processing as research data because there are

15 items above the 0.300 threshold. All variables fall into the reliable group, as indicated by the Reliability test results in Table 2, where the scores are more than 0.700. As a result, the research tools utilized in this study for each variable can be regarded as trustworthy and as very stable measuring devices. This implies that the instrument testing results will remain the same when the measuring tool is used again.

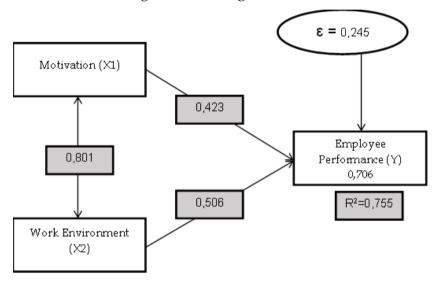

Figure 1. Path Analysis Outcomes

The motivation (X1) and work environment (X2) variables in the study findings in the above picture have a correlation coefficient of 0.801. This finding suggests that the variables of work environment (X2) and motivation (X1) have a substantial effect. Additionally, 0.423 is the regression coefficient (path coefficient) that the Motivation (X1) variable has toward the Employee Performance (Y) variable, and 0.506 is the regression coefficient (path coefficient) that the Work Environment (X2) variable has toward the Employee Performance (Y) variable.

Discussion

The Influence of Motivation on Performance

The findings of the study show that employee performance is supported by motivation. The statement that got the highest score, "With praise from superiors, I am more motivated to work even better," is related to this. It indicates that leaders significantly impact their team members, making them feel inspired and driven to work hard and enthusiastically finish tasks fast. Hersona and Sidharta (2017) highlight that motivation is a crucial element that, when combined with effective leadership and work discipline, can lead to improved employee performance. Their study indicates that motivated employees are more likely to engage in their tasks with enthusiasm and dedication, ultimately contributing to the overall success of the organization. Syaifuddin and Sidharta (2017) explore the relationship between employee desire and organizational climate, emphasizing that a positive work environment can amplify the effects of motivation on performance. They argue that when employees feel motivated and supported within a conducive climate, their performance levels increase significantly. This suggests that motivation does not operate in isolation; rather, it interacts with various factors, including workplace culture and leadership styles, to influence how well employees perform.

ISSN Online: 3026-0906

The Influence of Work Environment on Performance

The study's findings demonstrate that employee performance is supported in the workplace. The statement, "The currently available work facilities are adequate to support work activities," received a high score. This suggests that while well-equipped workspaces facilitate employees' ability to do their jobs, the work environment is critical in improving employee performance. Machmud and Sidharta (2021) examine the effects

of working conditions on employees' quality of life, especially in the context of the COVID-19 pandemic. Their findings suggest that a positive work environment, characterized by safety, comfort, and support, can enhance employees' overall well-being, which in turn boosts their performance. When employees feel secure and valued in their surroundings, they are more likely to be productive and committed to their tasks.

Additionally, Sidharta (2024) investigates the role of employee engagement in behavioral performance within public organizations in Bandung, Indonesia. This study highlights that a supportive work environment fosters higher levels of employee engagement, which is directly linked to improved performance outcomes. Engaged employees are more likely to go above and beyond in their roles, demonstrating initiative and a strong commitment to their work.

The Influence of Motivation and Work Environment on Employee Performance

The survey results clearly show that, compared to the work environment, the motivation variable significantly impacts performance. The work environment variable in this study is not dominant, meaning that it cannot stand alone or does not significantly affect employee performance. In contrast, motivation is the dominating variable in this study and can stand alone without effect from other variables. Nafukho et al. (2023) explore how training design can mediate the relationship between participants' motivation, their work environment, and the transfer of learning. Their findings suggest that when training programs are well-structured and aligned with motivational strategies, employees are more likely to apply what they have learned in their work settings. This indicates

that a supportive work environment, combined with effective motivation techniques, can significantly enhance employee performance by facilitating the practical application of skills and knowledge.

In a complementary study, Nguyen and Nguyen (2023) investigate the concepts of employer attractiveness and employee engagement, linking them directly to employee performance. They argue that a positive work environment, characterized by supportive leadership and a strong organizational culture, can attract talent and foster higher levels of engagement. Engaged employees, who feel motivated and connected to their organization, tend to perform better, demonstrating increased productivity and commitment to their roles. Hessari et al. (2025) address the issue of cyberloafing and its impact on performance, emphasizing the role of a competitive work environment and employee adaptability. Their research highlights that a dynamic and challenging work environment can motivate employees to remain focused and engaged, thereby reducing distractions and enhancing overall performance.

Conclusion

The research findings clearly show that motivation has a favorable impact on worker performance. This is because workers believe the organization has significantly benefited them, which inspires them to aim for advancement and boost productivity. The study also shows that the workplace impacts employee performance. It demonstrates how lower employee performance might result from an uncomfortable work environment. After calculating the coefficient of determination (R-squared), which shows the percentage indicating the contribution of all independent variables, in determining variations in Employee

Performance, the influence of Motivation and Work Environment is further highlighted.

The organization must enhance employee performance through improved work environment and motivation. This research shows that motivation and the workplace significantly impact employee performance. Improving these two factors is essential if the organization wants to develop workers' potential, motivate them to work hard and efficiently, comply with policies and procedures, and produce the best possible job output. The combined insights from these studies underscore the critical importance of both motivation and work environment in shaping employee performance. Organizations that effectively integrate motivational strategies with a supportive and engaging work environment are likely to see improved performance outcomes. This dual focus not only enhances employee satisfaction but also drives organizational success in a competitive landscape. The author also recommends that others conduct further research or that additional factors influencing performance not covered in this study be looked into.
